The carrier having two or more gas passages (cells) partitioned and formed by a partition wall formed of a porous body, the catalyst behind independently disposed in some of the cells, the selectively permeable membrane is independently disposed in the remainder of the cells. Specifically, two or more gas passage cells are partitioned from and formed of a porous body wherein the catalyst is disposed in one cell and the selectively permeable membrane being disposed in an adjacent cell, the two cells being separated by a partition wall, the partition wall physically separates the catalyst and the permeable membrane from one another the reason for the partition or the need for a partition has not been recognized or taught by the prior art which is to prevent clogging of the permeable membrane by the catalyst.
